

Sensing Contrast vs Time Interval (discrete mode)

Detection Probabilities vs Time Interval

SYSTEM PARAMETERS AND CONFIGURATION

Physical Constants:

- Photon-cavity coupling (γ): 0.188496 rad/time
- Inverse pulse width (σ): 0.018850 1/time
- Dispersive coupling (χ): 0.094248 rad/time

Noise Configuration:

- Relaxation (γ_{relax}): 0.000000 rad/time
- Dephasing (γ_{deph}): 0.000000 rad/time
- Depolarizing (γ_{depol}): 0.000000 rad/time

Measurement Protocol:

- Initial time: -424.413182 | Final time: 424.413182
- Total evolution: 848.826363
- Batch size: 1 realizations
- Computation mode: discrete

Landscape Statistics:

- Contrast range: [0.739579, 0.994607] | Variation: 2.55e-01
- Optimal interval: 848.826363 | N_measurements: 2 | Contrast: 0.99460719
- Interval range: [17.322987, 848.826363]
