

Sensing Contrast vs Time Interval (discrete mode)

Detection Probabilities vs Time Interval

SYSTEM PARAMETERS AND CONFIGURATION

Physical Constants:

- Photon-cavity coupling (γ): 15.000000 rad/time
- Inverse pulse width (σ): 1.000000 1/time
- Dispersive coupling (χ): 7.500000 rad/time

Noise Configuration:

- Relaxation (γ_{relax}): 0.010000 rad/time
- Dephasing (γ_{deph}): 0.010000 rad/time
- Depolarizing (γ_{depol}): 0.010000 rad/time

Measurement Protocol:

- Initial time: -5.000000 | Final time: 5.000000
- Total evolution: 10.000000
- Batch size: 1 realizations
- Computation mode: discrete

Landscape Statistics:

- Contrast range: [0.672050, 0.791360] | Variation: 1.19e-01
- Optimal interval: 1.000000 | N_measurements: 11 | Contrast: 0.79136020
- Interval range: [0.200000, 10.000000]
